

Stablecoins Commerce Stack · Best Agentic Economy Experience

ArcEscrow

Agentic Letter of Credit for cross-border SME trade on Arc.

USDC escrow waits for delivery proof, evaluator approval, and auditable receipt evidence instead of behaving like a blind wallet transfer.

Track **Best Agentic Economy Experience**

Live primitives **USDC · ERC-8004 · ERC-8183**

Status **Functional Arc Testnet MVP**

Live demo: arc-agentic-settlement-lab.vercel.app

The product is not “another transfer UI.”

SME cross-border trade has a trust gap: buyers do not want to pay before proof; suppliers do not want to deliver before payment assurance.

Buyer risk

Pays upfront, then waits on shipping and document quality.

Supplier risk

Ships first, then waits on payment/default risk.

Bank L/C friction

Weeks of paperwork, high fees, weak access for smaller firms.

ArcEscrow answer

Turn a supplier payment into a programmable letter of credit: create deal → lock USDC → submit proof → evaluator approves → export receipt.

One settlement lifecycle, six accountable states.

The user sees a business workflow first; wallet signatures become evidence inside the deal room.

Working MVP

Built product surfaces, not only documentation.

The MVP is deployed and structured around reviewer-visible product pages: overview, deal room, identity proof, and submission evidence pack.

Video
45s hosted demo

The evaluator is the release gate.

ArcEscrow separates wallet action from business approval: the evaluator checks deal terms, escrow evidence, delivery proof, and agent identity before settlement.

ERC-8004 identity reads

`ownerOf(agentId) · tokenURI(agentId)`

Why it matters: payment release becomes an auditable business decision, not an invisible automation or a raw transfer hash.

Arc primitives map to a real trade workflow.

Implemented path is solid-line. Next integrations are marked as extensions, not claimed live.

Documented next integrations; not selected as live MVP products.

Defensible claims are explicit.

Primitive	Status	Use in ArcEscrow
USDC on Arc	LIVE	Settlement asset and gas rail
Arc Testnet	LIVE	Execution + contract reads
ERC-8004	LIVE	Agent identity verification
ERC-8183	LIVE	Job lifecycle tx builder
Circle Wallets	NEXT	Policy treasury / onboarding
Gateway / Nanopayments	NEXT	Paid document/API access
CCTP / Bridge Kit	OPTIONAL	Cross-chain buyer funding
USYC / StableFX	GATED	Conceptual extension only

Strong submission, honest boundary.

Ready now

Live app, public repo, hosted video, API surface, submission pack, product feedback.

Onchain partial

Identity reads and ERC-8183 transaction preparation are implemented on Arc Testnet.

Strongest upgrade

Complete one wallet-signed createJob → setBudget → approve → fund → submit → complete tx sequence.

Do not overclaim

- Do not select Circle Wallets / Gateway / CCTP / USYC / StableFX as live integrations.
- Do not claim full onchain-verified ERC-8183 settlement until all tx hashes are recorded.
- Use walkthrough video as current evidence; replace with tx-backed recording after final run.

The Stablecoins Commerce Stack Challenge

Submission evidence pack

This page frames the product across SME trade workflow, cross-border settlement, and agentic economy: an importer agent settles a supplier invoice with USDC on Arc, verifies agent identity, uses a budgeted ERC-8183 lifecycle, and produces an auditable receipt.

READY FOR INITIAL SUBMISSION

Submission verdict

Remaining evidence improvements

- No live Arc Testnet tx hashes yet — the full ERC-8183 sequence has not been wallet-signed and recorded.
- Demo video is now available; a wallet-signed run video can be added after the final tx sequence.
- Circle Wallets, Gateway, Nanopayments, CCTP, USYC, and StableFX are not integrated — these must not be claimed as live.

Defensible live claims

- USDC on Arc — settlement asset and gas rail used throughout the lifecycle.
- ERC-8004 agent identity — ownerOf and tokenURI reads from Arc Testnet IdentityRegistry.
- ERC-8183 lifecycle — calldata preparation for all six lifecycle actions, wallet tx submission, and receipt parsing.
- Deterministic settlement receipt — JSON and Markdown with receipt hash and deliverable hash binding.

Minimum path to stronger evidence: complete one end-to-end wallet-signed run on Arc Testnet and replace the walkthrough video with a tx-backed recording.
